**Front Cover Picture:** Early cleavage stage of human embryonic development. The number of blastomeres is four, and in addition the polar bodies are seen within the zona pellucida. There are two clusters of cumulus cells, remnants of the cumulus oophorus, which still adhere to the early embryo during its passage through the oviduct cavity.

With grateful permission from the Swedish book "Ett barn blir till" by Lennart Nilsson and Lars Hamberger, Albert Bonniers Förlag AB, Stockholm.
