January 2011

-
- 1-10** Sequence variation of *Pleurotus* species collected from Eastern Asia. A. IMTIAJ, T. S. LEE AND S. OHGA
Native genetic resources of oyster mushrooms from China, Korea, and Taiwan are compared, and their genetic relationships established using DNA sequences from the ITS region.
- 11-19** Fungal diversity in soil samples from a Mexican region with endemic dermatomycoses. R. MUNGUÍA-PÉREZ, E. DÍAZ-CABRERA, N. MARTÍNEZ-MONTIEL, J. MUÑOZ-ROJAS AND R. MARTÍNEZ-CONTRERAS
Several fungal species associated to dermatomycoses were found inhabiting the soil, and identified by classical and molecular methods. The region studied has been characterized by a relative high frequency of superficial mycoses in the local people.
- 21-27** Tannase production under solid and submerged culture by xerophilic strains of *Aspergillus* and their genetic relationships. A. A. DE LA CERDA GÓMEZ, M. H. REYES VALDÉS, N. P. MELÉNDEZ RENTERÍA, R. RODRÍGUEZ HERRERA AND C. N. AGUILAR
Native strains of *Aspergillus* isolated from a Mexican semi-desert region were found to produce high levels of tannase enzyme by solid and submerged fermentation. Four species were identified at the molecular level.
- 29-33** The good and the bad: fungi in Africa. R. H. KURTZMAN, JR.
There is increasing interest for the production and consumption of edible mushrooms in Africa. This is the case of Mozambique and Ghana supported by international organizations.
- 35** List of reviewers. THE EDITORS
Our reviewers for 2010.
