			Cover The mongoose lemur <i>Eulemur mongoz</i> , native to Madagascar and introduced to the Comoros, is categorized as Critically Endangered. The Comoros population is important because it is a valuable genetic reservoir in view of the threats to the species on Madagascar. A survey of the species on Anjouan and Mohéli has revealed no evidence of an impact of anthropogenic disturbance on abundance, although group size and composition were sensitive to human impacts. For further details, see pp. 60–67. (Photograph © Frans Lanting / Getty)
