Editorial

205 Modern food emissions

Comments

206 **Research on public support for climate policy instruments must broaden its scope**
Steffen Kallbekken

209 **Reducing personal climate risk to reduce personal climate anxiety**
Jeremy Fyke & Andrew Weaver

Research highlights

211 Our choice from the recent literature

News & views

212 **Landscape genomics**
Hybridization provides climate resilience
Sheela P. Turbek & Scott A. Taylor

Policy brief

214 **Energypolicy**
Public acceptance of fossil fuel subsidy removal can be reinforced with revenue recycling
Niklas Harring, Erik Jönsson, Simon Matti, Gabriela Mundaca & Sverker C. Jagers

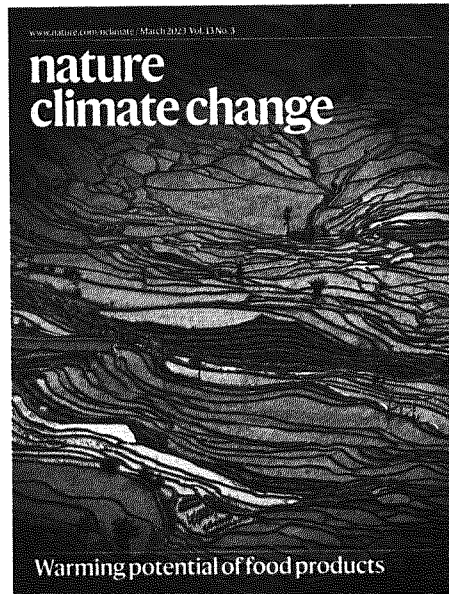

Research briefings

216 Flood risks are insufficiently priced into housing markets but better pricing would leave some worse off

218 The changing climate could lead to carbon losses in the tropics

220 Likelihood of back-to-back tropical cyclone hazards is increasing

222 Winter sea-ice growth in the Arctic impeded by more frequent atmospheric rivers

ON THE COVER

The food sector is a major source of greenhouse gas emissions. However, estimates of this sector's global warming potential based on granular data, such as individual gas species or food items, are lacking. In this issue, Ivanovich et al. show that global food consumption alone could add nearly 1°C to warming by the end of this century, which is mostly driven by foods that are high sources of methane.
