VII. QUALITATIVE AND QUANTITATIVE DIFFERENCES BETWEEN SPECIES IN THE GUT IMMUNE SYSTEM: CONTROVERSIAL AND UNSOLVED ASPECTS <i>(Reinhard Pabst and Hermann-Josef Rothkötter)</i>	73
Summary	73
Introduction	73
Peyer's patches differ in number, size, and function between species	75
Major differences in numbers and markers of M-cells	76
Lymphoid structures recently found in the gut wall	76
Why are there such different numbers of intra-epithelial lymphocytes expressing the $\gamma\delta$ T-cell receptor?	77
Antigen presentation in the gut wall	78
Ig-A-producing plasma cells in the gut wall have different origins	78
Postnatal development of the gut immune system	78
Acknowledgements	79
Literature	79
VIII. M-CELLS AND THEIR ROLE IN INFECTION: A REVIEW <i>(Mark A. Jepson and M. Ann Clark)</i>	83
Summary	83
Introduction	83
M-cell characteristics and their identification	84
Development and regulation of the M-cell population	86
Interaction of micro-organisms with M-cells	87
Discussion	95
Acknowledgements	96
Literature	97
IX. HYPOTHESIS ON THE PHYSIOLOGICAL CONTROL OF INFECTIONS BY OPPORTUNISTIC (POTENTIALLY PATHOGENIC) MICRO-ORGANISMS <i>(Dirk van der Waaij)</i>	103
Summary	103
Introduction	103
The contribution of each of the four defence layers	106
Hypothesis	107
A retrospective analysis of mouse data representing most of the	
Flow of events after ingestion of an opportunistic micro-organism	108
An <i>in vivo</i> model for microbial infection, colonisation, translocation, and clearance	110
Research priorities for the study of existence of co-operative interactions between defence factors	113
Literature	114
