

Managing the World of Information

Petra Hauschke

GLOMAS Deutschland GmbH

Agenda

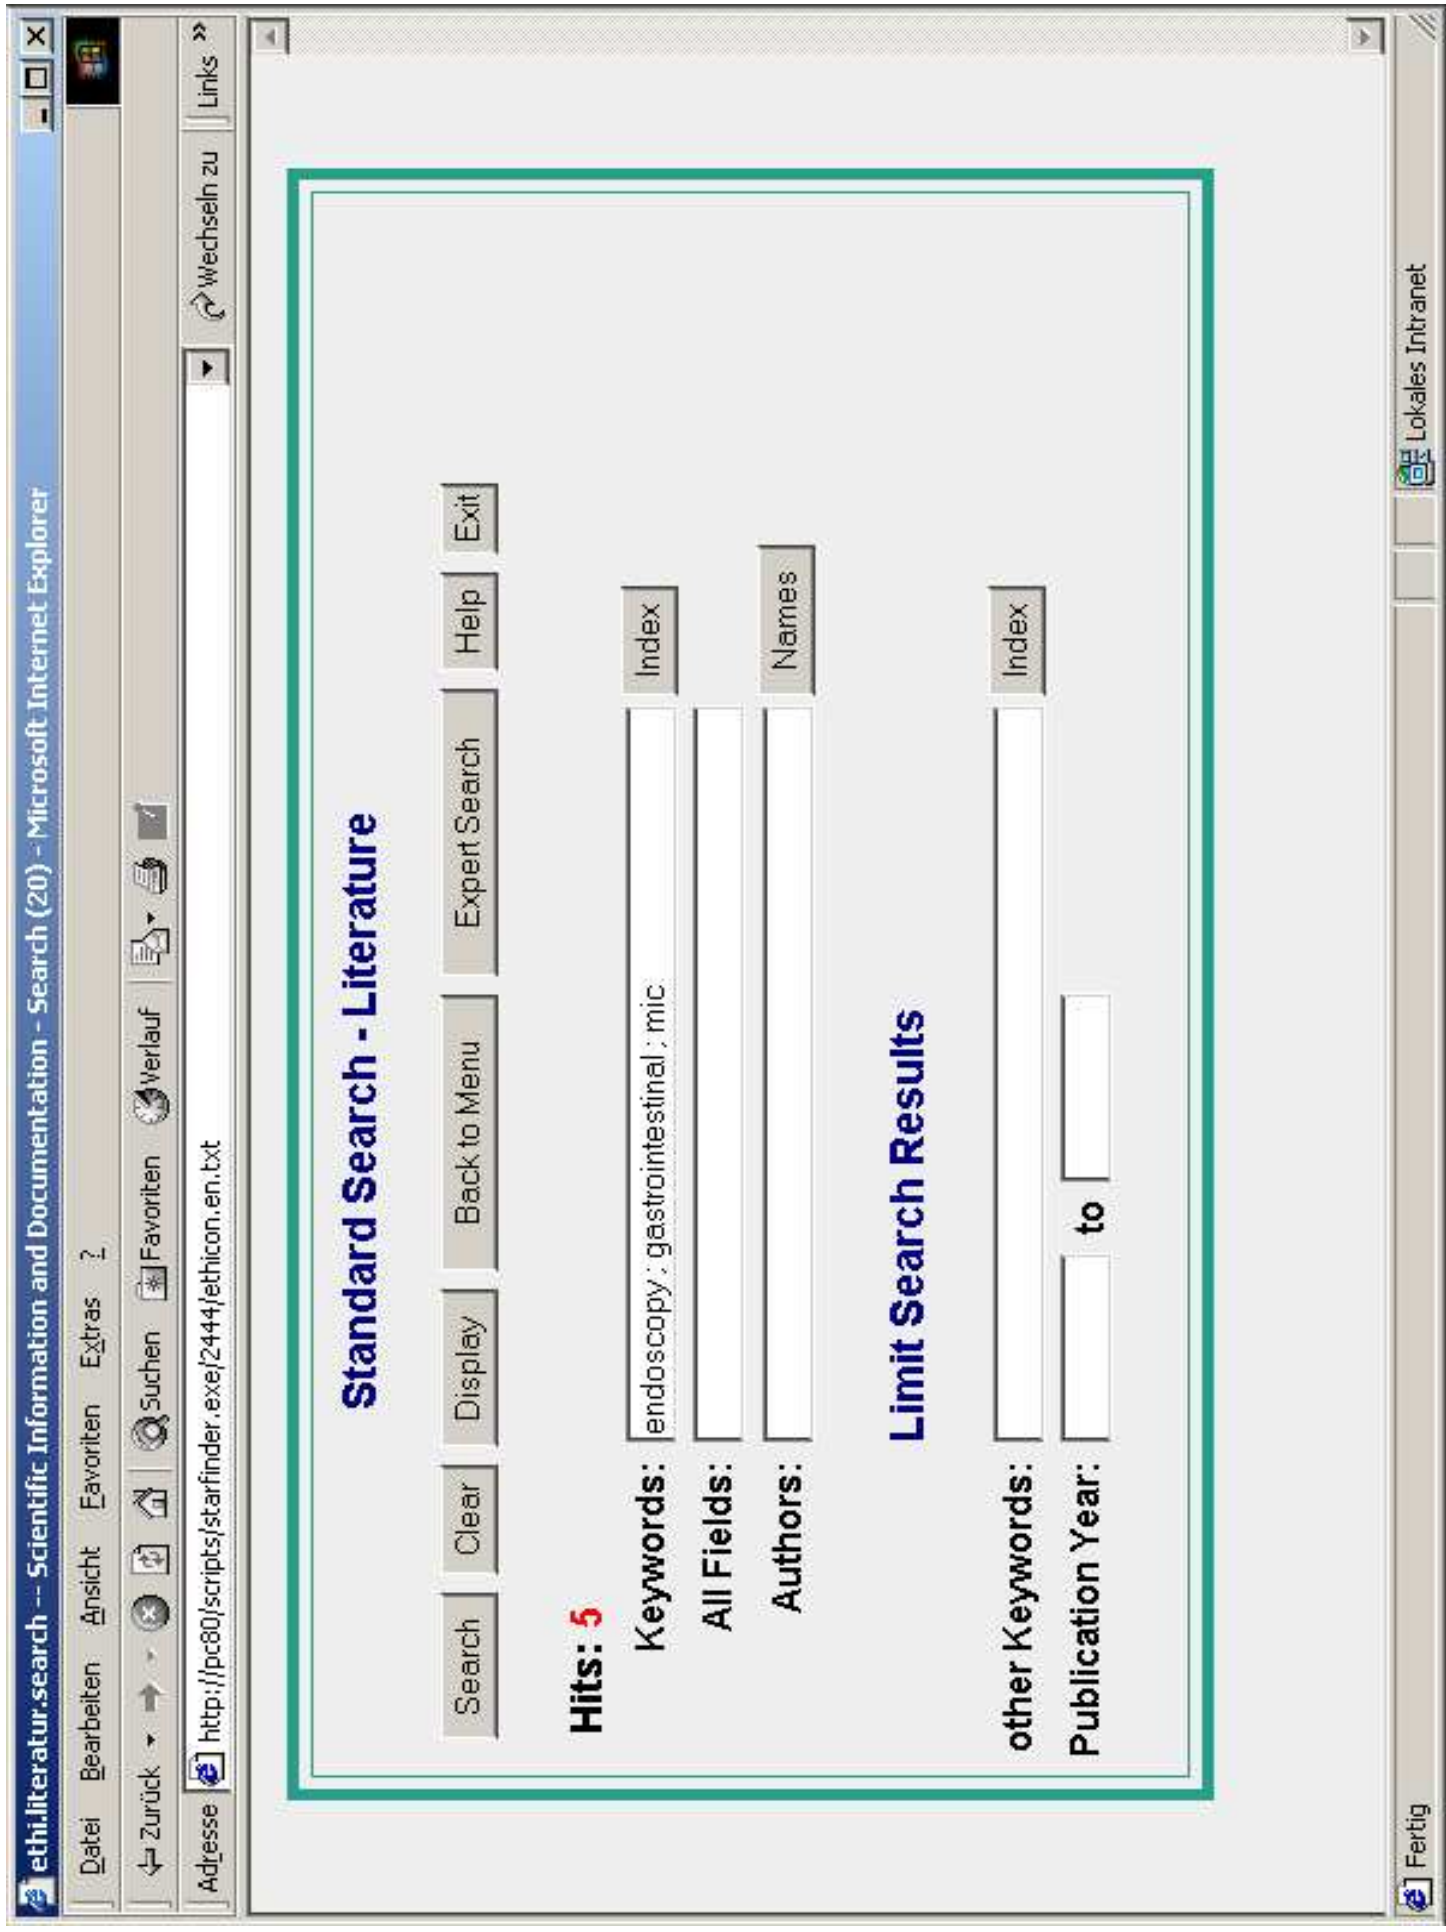

- STAR our Tool to manage it
- Products based on STAR
- About the Glomas Companies
- Our Customers

STAR

- is developed by Cuadra Ass. USA
- is an award-winning multi-user, multi-purpose, customizable client-server software package
- supports management of special libraries, technical information centers, museums, archives, central files and records centers and competitive intelligence units
- is the management tool for electronic data files and other parts of the corporate memory
- provides the possibilities to develop your own applications

STAR's retrieval

- Boolean operators
- proximity operators
- nesting
- combination of sets
- specific fields searching
- fuzzy searching
- relevancy ranking
- automatic searching of broader/narrower terms
- relational searches and reports

STAR interfaces

- [STAR Client](#), a Microsoft Windows-based graphical user interface
- [STAR Web](#), a Web browser-based user interface
- [STAR Z39.50](#), for client/server information retrieval via the international standard protocol
- **Classic STAR**, a built-in, character-based interface, for use on ASCII terminals or terminal emulators on PCs, Macintoshes, or Unix workstations

STAR Client special features

- Hierarchical and task-oriented menus
- customizable search forms linked to specific search specifications, including index and field information displays
- searches can be displayed for browsing, printing, and exporting
- Input forms can be designed with a few or hundreds of fields
- Picklists to support valid and quick input are generated dynamically

STAR Client Task List - localhost / tibbs

STAR Z39.50

The ANSI/NISO Z39.50-1995 (ISO 2395) international standard defines a computer-to-computer client/server information retrieval protocol

The Z39.50 protocol allows users to enter search requests, with Boolean and proximity operators, and display retrieved records.

It also provides for searching multiple databases, across multiple host systems, with a single search request.

STAR XML / ADO Interface

XML (Extensible Markup Language) is an industry-standard language for the exchange of structured documents and data. Adoption of XML technology is growing rapidly due to the wide availability of XML tools, integrated support for XML in the latest web browsers, and the backing of Microsoft, IBM, and other major manufacturers.

ADO (ActiveX Data Objects) is a Microsoft standard technology used to enable applications to access, read, add, update, and delete data in local or remote databases. It is programming language independent and DBMS independent, making it a good choice for open standard database programming on the Windows platform.

Other interfaces included with STAR

- **STAR Manager**, a web browser interface for STAR system management operations
- **STARfetch**, software that allows electronic files to be retrieved, displayed, and downloaded by STAR Client and STAR Web in a secure, managed environment

Products based on STAR

- **STAR/Libraries/Marc** for integrated special library/information center operations
- **STAR/Archives** for document, film, photo, and object archive management
- **STAR/Digital Assets**, for document management
- **STAR/Images** for for managing collections of photographs and related media in both digitized and non-electronic formats

Products based on STAR

- **STAR/SDI** for selective dissemination of information
- **STAR/RIMS(-E)** for versatile, cradle-to-grave records management and certified (DoD 5015.2-STD) management of both electronic and paper records
- **STAR/Publishing** for one-step composition, through linkage with FrameMaker
- **STAR/Thesaurus** for developing and maintaining vocabulary control databases
- **STAR/Museums** for collections management applications
